

In Entrepreneurship Directions for Increasing the Efficient use of Resources

Ibrokhimov Mukhammadjon Abdullajanovich

University of Business and Science

Abstract: In the development of the economy of our republic, an entrepreneur is primarily a person with a certain level of qualification, who has the authority and responsibility to implement the company's development strategy, such as profit, profitability, and labor productivity. In the article, the interrelationship of the factors of effective use of resources in business enterprises improved.

Keywords: environment, business, entrepreneurship, investment, entrepreneurial activity, foreign investment, investment system.

The reforms that are being carried out for the stable and effective development of the economy of our country are the implementation of deep structural changes in the economy in a short period of time, the development of production and services, ensuring the growth of the population's income, the sustainable development of small business and private entrepreneurship, significant achievements were made in strengthening the activity of the banking and financial system, in the development of scientific projects.

The Republic of Uzbekistan "On measures to fundamentally update the state policy on economic development and poverty reduction" and "Ministry of Economic Development and Poverty Reduction of the Republic of Uzbekistan and on the organization of the activities of its system organizations" as well as the new development strategy of Uzbekistan for 2022-2026 adopted in our country to ensure rapid development of the national economy and high growth rates. By ensuring stable high growth rates in economic sectors, in the next five years, the gross domestic product per capita - 1.6 times, and by 2030, the per capita income will increase from 4 thousand US dollars, and "Income creating the ground to join the ranks of "above-average countries". Therefore, the development of management activity is considered one of the urgent issues today [2].

Today, the role and importance of entrepreneurs in the development of the economy is very great. Therefore, in order to further increase the contribution of entrepreneurship to the economy, it is necessary to use production resources and economic potential effectively. In the conditions of digitization of the current economy, ample opportunities for the use of computing equipment, computers and information technologies should be created to fulfill this task. As a result of the creation of these opportunities, it is possible to reduce labor costs and reduce the cost of manufactured products. The introduction of improved information technologies leads to a reduction in the consumption of all material resources. This is very important for business enterprises. Because material costs have a very high share in the product cost. As a result of the use of information technology, improvement and coordination of technology, the consumption of raw materials and materials is reduced, mainly through the means of reducing waste and defects.

As a result, an increase in the coefficient of use of material resources and the percentage of output of finished products from raw materials is achieved [5].

In addition, in order to increase the contribution of business enterprises to the economy, it is considered an important step to adapt the raw materials and materials used in them to the working technology. At the same time, implementation of the following directions will increase the contribution of business enterprises to the economy:

- simplification of the level of complexity of the products produced in business activities, without affecting the quality.
- f is evidence of n in practice cheap kind of of materials use _ Using these materials without reducing the technical characteristics of the manufactured products and improving their external design.
- creation of cost-effective and high-performance workstations and devices in business enterprises. A basis and incentive should be created for every business enterprise to engage in innovative activities. They should also make efforts to create more efficient workbenches and equipment.
- adaptation and coordination of all types of products in business production [6].

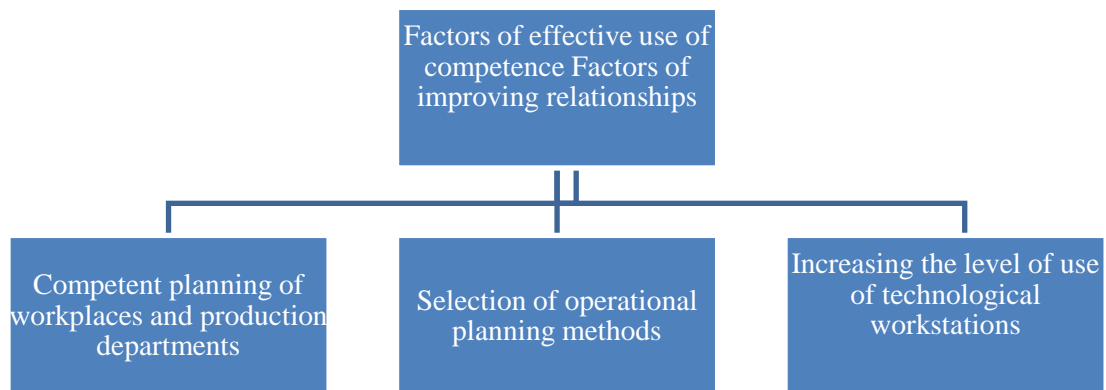

Figure 1. Factors of improving the interaction of the factors of effective use of ¹resources in business enterprises

As we know, by improving the relationships of all factors that lead to effective use of production potential in enterprises engaged in entrepreneurial activity, it is possible to increase their contribution to the economy (Fig. 1). Improving their interaction with each other is expressed by implementing specific organizational and technical measures.

Also, production continuity is of great importance in ensuring the effective use of production resources in business enterprises and includes the following:

- planning continuity.
- production process continuity.
- continuity of material and equipment supply.
- continuity of control.
- continuity of analysis of production situation.
- continuous employment of employees and workstations.

From this In addition, the continuity of the planning process in business enterprises is ensured by the implementation of the work specified in the current plan of the enterprise, as well as by

¹Author development.

including the next work. Only when this is done, it is possible to analyze the preparation of the production in time, it is possible to produce the product within the specified time. The continuity of planning implies the continuity of the production process. The continuity of the production process is one of the important factors that ensure the effective use of available production resources [5].

In conclusion, based on the above, it should be noted that today's changes in the conditions of globalization of the economy and the tightening of competition are changes in the technical conditions of production, the acceleration of the process of arming with new techniques, the production of products or services in business activities. It requires the introduction of new technologies of display, the organization of material equipment supply and the implementation of similar functions. This determines the country's perspective.
